

Money and Barter in the Field: Evidence from the Life and Death of a Digital Currency

Michael B. Wong (HKU)

Summer Workshop on Money, Banking, Payments, and Finance

August 2024

Motivation

- ▶ A large New Monetarist literature on the microfoundation of money and barter has developed in theory and in lab experiments (e.g. Lagos, Rocheteau and Wright 2017; Rocheteau and Nosal 2017; Duffy 2016; Hommes 2020)
 - ▶ Characterize behavior given assumptions about info and trade sequence
 - ▶ Much learned about simulated environments
- ▶ Unclear whether assumptions are consistent with actual trade
 - ▶ Barter is typically informal and unrecorded
 - ▶ Quantitative evidence on barter very rare
- ▶ Advent of online platforms and digital currencies present new avenues for studying money and barter in the field

This paper

- ▶ New high-frequency barter and token transaction data in the field
 - ▶ Covers rise and fall of redeemable money in a Toronto-based barter platform
- ▶ Event studies of unexpected monetary experiments
 1. Fivefold monetary expansion (Event study #1)
 2. Sudden reductions in token redemption (Event study #2, #3)
- ▶ Question: Which models are most consistent with monetized and barter exchange in the field?

Preview of Results

Main Empirical Findings

1. No detectable change in posted token price throughout
2. Monetary expansion \implies transactions \uparrow
3. Reduced redemption \implies token acceptance \downarrow , transactions \downarrow

Preview of Results

Main Empirical Findings

1. No detectable change in posted token price throughout
 2. Monetary expansion \implies transactions \uparrow
 3. Reduced redemption \implies token acceptance \downarrow , transactions \downarrow
- \implies Consistent only with New monetarist models with price coordination frictions (e.g. Green Zhou 1998, 2002; Kamiya Shimizu 2006, 2007a,b, 2011; Jean Rabinovich Wright 2010)

Preview of Results

Main Empirical Findings

1. No detectable change in posted token price throughout
 2. Monetary expansion \implies transactions \uparrow
 3. Reduced redemption \implies token acceptance \downarrow , transactions \downarrow
- \implies Consistent only with New monetarist models with price coordination frictions (e.g. Green Zhou 1998, 2002; Kamiya Shimizu 2006, 2007a,b, 2011; Jean Rabinovich Wright 2010)
- \implies Additional margins of responses not currently in most New Monetarist models (e.g. entry, redemption, search effort, reputation)

Setting and Data

The Bunz community (initially "Bumz")

- ▶ Started in 2013 as a Facebook group in Toronto for cash-constrained millennials to exchange personal possessions
- ▶ Since 2016, trades conducted through a mobile app
- ▶ ~ 10,000 daily active users (circa early 2019), mostly young adults

Demographics

Features of the Bunz economy

- ▶ Items are highly heterogeneous (e.g., used clothing, accessories, plants, food)
- ▶ Participants are strangers
- ▶ No repeated interactions
- ▶ No credit or banks
- ▶ No cash (anti-capitalist ideology, enforced by removal of item posts)
- ▶ Searching for items takes time

Barter mechanics:

- ▶ Sellers post items (e.g. used clothing, plants)
- ▶ Sellers post an "ISO" list ("in search of")
- ▶ Buyers search or browse
- ▶ Buyers make an offer
- ▶ Buyer and seller message to meet

Message example

ISO example

Introducing BTZ

In April 2018, Bunz introduced BTZ

- ▶ Issued by platform. Users endowed with 1000 BTZ. Users earn more by inviting friends, posting items, or answering surveys, but cannot buy.
- ▶ Redeemable via Shop Local at fixed price. Users can redeem 100 BTZ for \$1's worth of goods at Shop Local stores, who are reimbursed by platform.
- ▶ Transferable among users via QR code or username
- ▶ No utility yield or storage cost
- ▶ No centralized exchange

Data

Bunz provided comprehensive, time-stamped user-level data including:

- ▶ Token transactions (sender, receiver, amount)
- ▶ User ratings (proxy for transaction completion)
- ▶ Item posts and descriptions (includes posted BTZ price)
- ▶ Messages (sender, receiver, text, offer messages linked to item post)
- ▶ User characteristics (including survey responses and geotag)

Limitations: Items not standardized; prices often not available

Regular users account for most platform activity

- ▶ Regular user definition:
 - ▶ at least 10 transactions total
 - ▶ less than 70% of transactions in single month
 - ▶ active for at least 6 months
- ▶ Accounts for:
 - ▶ 8% of active users
 - ▶ 83% of transactions (measured by ratings)
- ▶ Among regular users, usage of the platform is highly persistent
 - ▶ Over 80% sent a message in the week one year after entry
- ▶ Will measure effects on all / regular / frequent users

Conceptual Framework

Kiyotaki Wright (1993) with redemption

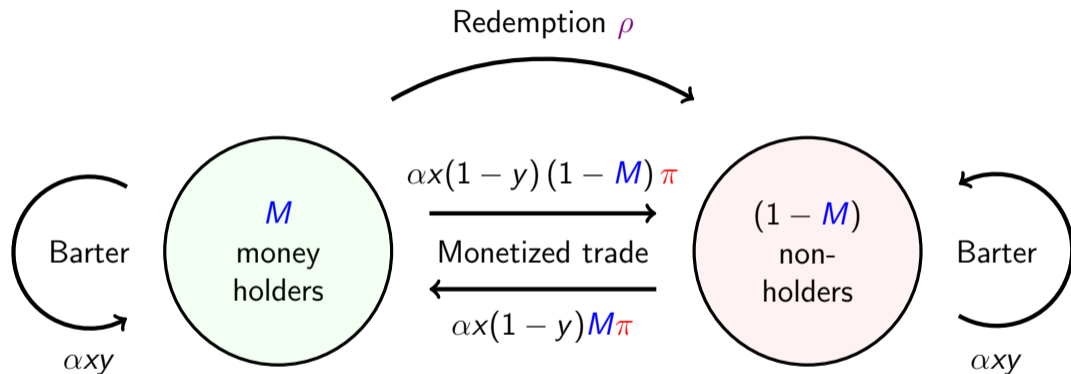

Kiyotaki Wright (1993) with redemption

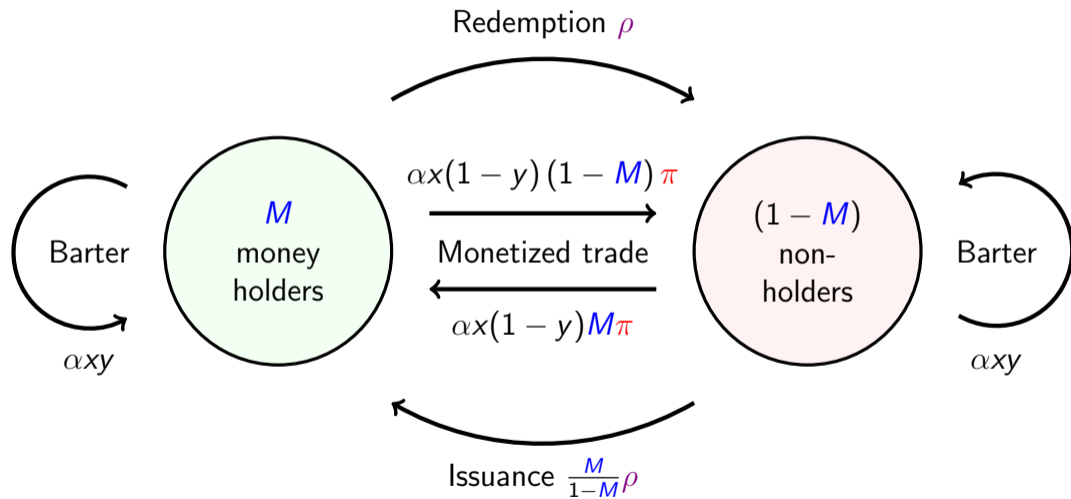

Kiyotaki Wright (1993) with redemption

Kiyotaki Wright (1993) with redemption

Kiyotaki Wright (1993) with redemption

Equilibrium

Suppose $M < \bar{M}$.

1. If $\rho > \rho_1$, there is a unique monetary equilibrium;
2. If $\rho \in [\rho_0, \rho_1]$, there is a monetary equilibrium and a non-monetary equilibrium;
3. If $\rho < \rho_0$, there is a unique non-monetary equilibrium.

Prediction 1 (Effect of Monetary Expansion)

Suppose $\rho > \rho_1$ and $M < \min\{\bar{M}, \frac{1}{2}\}$. If M increases, then:

1. Peer-to-peer monetized transaction volume increases; and
2. Barter transaction volume is unchanged.

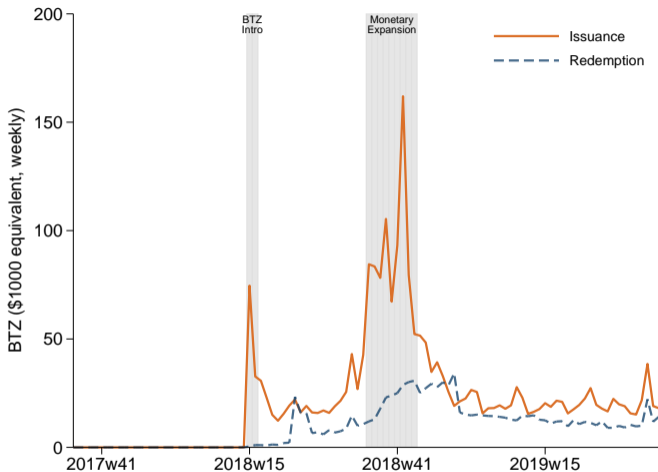

Prediction 2 (Effect of Reduced Redemption)

Suppose $M \in (0, \bar{M})$. If ρ declines from above ρ_1 to below ρ_0 , then:

1. Token acceptance decreases;
2. Peer-to-peer monetized transaction volume decreases; and
3. Barter transaction volume is unchanged.

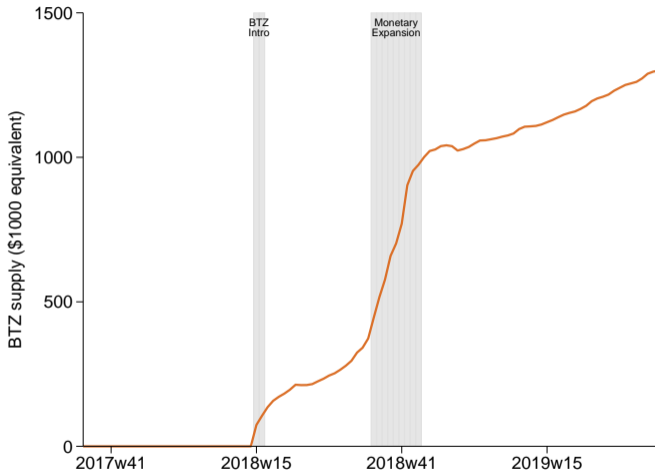

Effect of Monetary Expansion

Large wave of token issuance in Oct 2018

Driven by increased "Daily BTZ Drop"

Token supply increased fivefold as a result

Token supply = cumulative issuance - cumulative redemption

Despite monetary expansion, token prices did not move

All posted token prices

Median posted token price

Measured using posted BTZ price of **store gift cards** / face value in dollars

Transactions increased by 57%; barter volume unchanged

Measured using user ratings upon trade completion

Result is similar for different subsets of regular users

All transactions

Barter transactions

Margins of adjustment

	All users (1)	Regular users (2)
(a) Total transactions	57%	57%
(b) Barter transactions	3%	2%
(c) Entry	59%	-1%
(d) Offer messages sent	41%	37%
(e) Transactions per offer	11%	14%
(f) Items posted	38%	38%
Number of users	215271	10790
Pre-event weekly transactions	1793	1489

Robustness

- ▶ No pre-trends in entry, exit, offer messages sent, transactions per offer
- ▶ Not driven by changes in beliefs about token value
 - ▶ No discontinuity in token acceptance [Details](#)
 - ▶ No change in redemption as share of expenditure [Details](#)
- ▶ Not driven by exogenous changes in redeemability
 - ▶ No discontinuity in availability of token-redeeming stores [Details](#)
- ▶ Not driven by exogenous increase in goods supply
 - ▶ Increase was gradual, suggesting learning over time [Details](#)

Effect of Reduced Redemption

Bunz announced reduction in redemption on September 9, 2019

After a deep dive into our company priorities, Bunz will only be running the Shop Local Program revolving around food and coffee, as this is where our focus will be moving forward.

Effective immediately, you will no longer be able to accept BTZ and convert them into CAD currency.

We will be locking your wallets, and everyone will be paid up to September 10th inclusive, so please don't worry about any revenue that you brought in through the program as we will be settling your account with you and removing you from the application.

User uproar widely reported on local news

Bunz in turmoil

The popular Bunz trading platform has made major changes to how the system operates with very little notice, users say.

Token redemption immediately spiked

“Eating like a king”

Despite run, total supply largely unchanged

Token prices also did not move

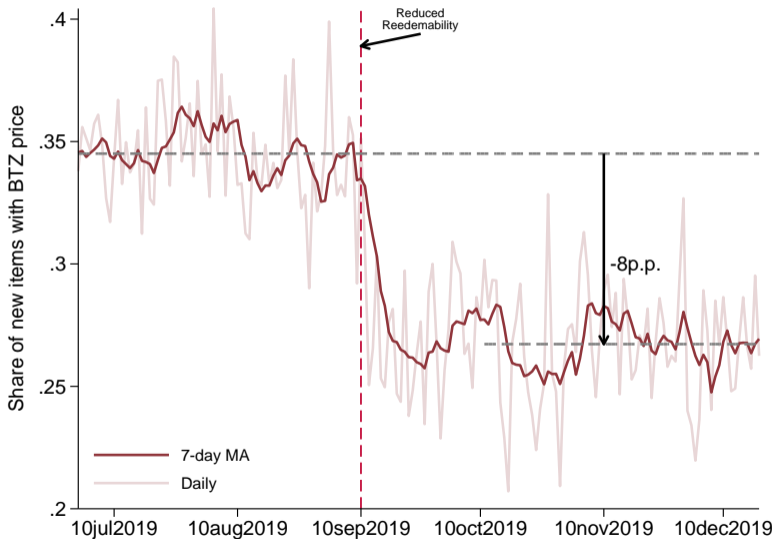

All posted token prices

Median posted token price

Measured using posted BTZ price of **store gift cards** / face value in dollars

Token acceptance immediately fell

Token-mediated and barter transactions both fell

Result is similar for different subsets of regular users

Token-mediated transactions

Barter transactions

Margins of adjustment

	All users (1)	Regular users (2)
(a) Token acceptance	-23%	-22%
(b) Token redemption	-31%	-1%
(c) Token-mediated transactions	-32%	-28%
(d) Barter transactions	-23%	-21%
(e) Entry	-61%	-56%
(f) Offer messages sent	-15%	-11%
(g) Transactions per offer	-12%	-13%
(h) Items posted	-29%	-23%
Number of users	215271	10790
Pre-event weekly transactions	2742	2218

Effect of Redemption Halt

BTZ Shop Local Redemption - Gaming Update

Please note that as of today, we will be temporarily pausing the Shop Local Program. An internal audit and review has been conducted of the BTZ rewards program and the Shop Local program, and despite many people using the program properly, several critical issues were flagged around the gaming of BTZ rewards. Our engineering team will be implementing additional checks and controls, which we will communicate out once those controls are in place. Any shops that participate in our Shop Local program will be paid up in full for any amounts owed up to the pause, and we will communicate with both the Shops and with the community once the protective changes are in place and the pause is lifted. We apologize for the short notice, and we appreciate your patience while we work. -Bunz

Token issuance and redemption immediately collapsed

Despite halt, token prices did not move

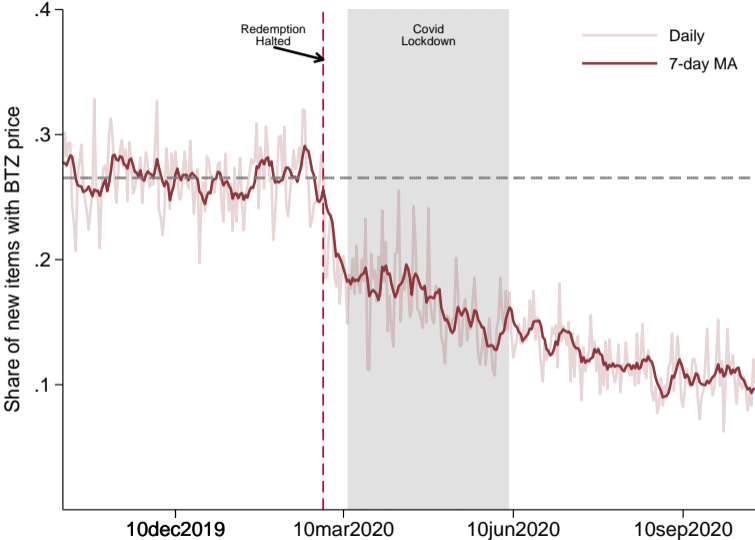

All posted token prices

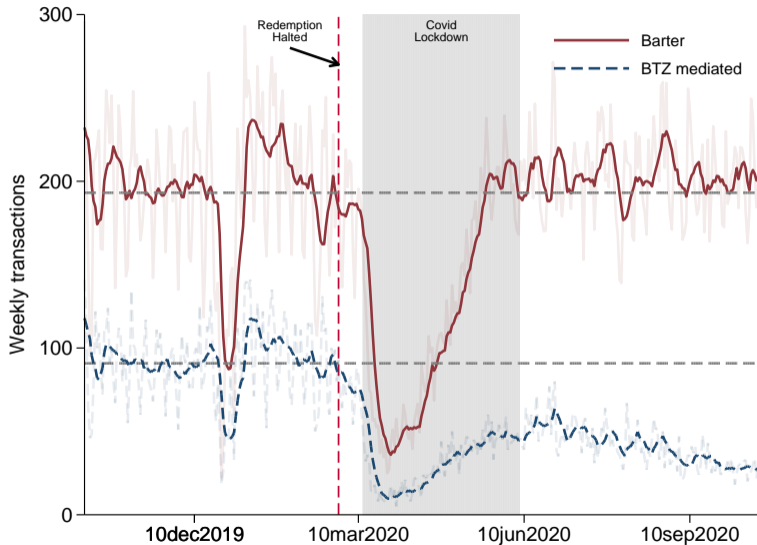

Median posted token price

Measured using posted BTZ price of **store gift cards** / face value in dollars

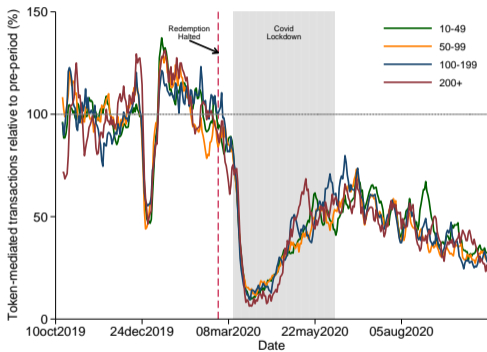

Token acceptance immediately fell

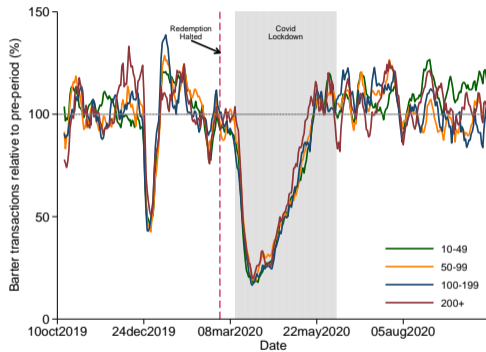

Token-mediated transactions fell, but not barter

Result is similar for different subsets of regular users

Token-mediated transactions

Barter transactions

Margins of adjustment

	All users (1)	Regular users (2)
(a) Token acceptance	-57%	-57%
(b) Token-mediated transactions	-58%	-57%
(c) Barter transactions	5%	5%
(d) Entry	-47%	-6%
(e) Offer messages sent	-14%	-13%
(f) Transactions per offer	-1%	-3%
(g) Items posted	-2%	-2%
Number of users	215271	10790
Pre-event weekly transactions	1988	1670

Discussion

Summary of Findings

- ▶ Main findings are consistent with conceptual framework:
 1. No change in token price throughout
 2. Monetary expansion increased transactions
 3. Reduced redeemability reduced token acceptance and transactions
- ▶ Additional margins of adjustment are revealed
 - ▶ Partial acceptability
 - ▶ Endogenous entry and search effort
 - ▶ Endogenous redemption volume \implies run dynamics
 - ▶ Trust and reputation \implies reduction in barter trade

Comparing Theory and Evidence

- ▶ Findings reject many canonical models:
 1. Rejects models where money is inessential (e.g., Arrow-Debreu)
 2. Rejects models w/o acceptance margin (e.g. MIU, CIA, Woodford 2004)
 3. Rejects models w/o price adjustment frictions (e.g., Lagos Wright 2005)
- ▶ Evidence explained by New Monetarist models with price coordination frictions (e.g., Green Zhou 1998, 2002; Kamiya Shimizu 2006, 2007a,b, 2011; Jean Rabinovich Wright 2010)
 - ▶ E.g. indivisible goods, price posting, random search
 - ▶ Money is essential; changes in redeemability can shift equilibrium

Conclusions

- ▶ Detailed data + monetary experiments in a real-world barter economy
- ▶ Takeaway: Severe price rigidity related to lack of centralized market
 1. No change in token price throughout
 2. Monetary expansion increased transactions
 3. Reduced redeemability reduced token acceptance and transactions
- ▶ Explained only by New Monetarist models with price coordination frictions (e.g. Green Zhou 98, 02; Kamiya Shimizu 06, 07, 11; Jean Rabinovich Wright 10)
- ▶ Reveals margins of responses absent from most models (e.g. entry, redemption, search effort, reputation)

Transition Probabilities

cf. Aiyagari and Wallace (1997) and Li and Wright (1998)

Bellman Equations

$$rV_1 = \underbrace{\alpha xy(u - c)}_{\text{barter}} + \underbrace{\alpha x(1 - y)(1 - M)\pi(u + V_0 - V_1)}_{\text{monetized trade}} + \underbrace{\rho(u + V_0 - V_1)}_{\text{redemption}}$$

$$rV_0 = \underbrace{\alpha xy(u - c)}_{\text{barter}} + \underbrace{\alpha x(1 - y)\pi M(V_1 - V_0 - c)}_{\text{monetized trade}} + \underbrace{\frac{M}{1 - M}\rho(V_1 - V_0)}_{\text{issuance}}$$

where $V_1, V_0 =$ value of holding / not holding money

Equilibrium

Suppose $M < \bar{M}$.

1. If $\rho > \rho_1$, there is a unique monetary equilibrium;
2. If $\rho \in [\rho_0, \rho_1]$, there is a monetary equilibrium and a non-monetary equilibrium;
3. If $\rho < \rho_0$, there is a unique non-monetary equilibrium.

Proof

Let π_0 and π_1 be prob of accepting and paying money, respectively. Then

$$\pi_j = \begin{cases} 1 \\ \in [0, 1] \\ 0 \end{cases} \iff \Delta_j \begin{cases} > 0 \\ = 0 \\ < 0, \end{cases}$$

where $\Delta_0 = V_1 - V_0 - c$, $\Delta_1 = u + V_0 - V_1$. Bellman equations imply that

$$\Delta_0 = \frac{\alpha x(1-y)(1-M)\pi(u-c) + \rho(u-c) - (r+\sigma)c}{r+\rho+\sigma+\alpha x(1-y)\pi},$$
$$\Delta_1 = \frac{(r+\sigma+\alpha x(1-y)M\pi)(u-c) + (r+\sigma)c}{r+\rho+\sigma+\alpha x(1-y)\pi} > 0.$$

$$\Delta_1 > 0 \implies \pi_1 = 1 \text{ and } \rho > \hat{\rho} \implies \Delta_0 > 0 \implies \pi_0 = 1 \implies \pi = \pi_0\pi_1 = 1.$$

Model assumptions and potential extensions

1. Indivisible money and goods
 - ▶ Divisible money; no centralized market \implies non-degenerate holdings
2. Homogeneous agents without ideological preference
 - ▶ Allow for agent heterogeneity (Shevchenko and Wright 2004)
3. Exogenous population, meeting probability, production speed
 - ▶ Endogenize entry, search / production effort
4. Agents redeem at exogenous rate
 - ▶ Endogenize with heterogeneous redemption cost
5. Platform always honors promise to redeem
 - ▶ Microfound with punishment / communal enforcement
